**Subject: Access Floor Panel Paint -- LEED-NC V3.0 Credit Compliance**

**Referenced Credit: EQ Credit 4.2: Low-Emitting Materials - Paints and Coatings**

To Whom It May Concern:

Tate Access Floors, Inc. declares that the VOC content of our panel paint is less than the content limit of 250g/L stipulated by EQ Credit 4.2 for anti-corrosive paints applied to interior ferrous metal substrates.

The following letter by the paint manufacturer indicates that the paint's VOC content is approximately 96g/L before it is cured and will therefore be less than 250g/L after it has been cured, since the curing process releases the volatile compounds from the paint film.

Dear Ms. Pippin,

We appreciate your interest in PPG products and are responding to your request to Gary Long for information on PPG products POWERCRON® CR691B and POWERCRON® CP558N. These formulations are manufactured with epoxy resins that are derived from bisphenol A. However, it is expected that free bisphenol A (CAS# 80-05-7) will be consumed during the polymerization reaction.

Based on our current knowledge of these products, their production processes, the information (such as safety data sheets [SDSs]) provided to PPG by its materials suppliers and the handling and packaging operations, PPG does not expect these products to contain free bisphenol A at quantities greater than hazard communications regulatory levels (1% or greater for hazardous ingredients and 0.1% or greater for carcinogens present).

Do not hesitate to contact me if you have additional questions regarding PPG products.

Sincerely,

A handwritten signature in cursive script that reads 'Jenna Schenker'.
